b) A low pass filter, in which a second switch device coupled to a second impedance, wherein by controlling the switching time of the first switch device and the second switch device, the equivalent impedance of the adjustable impedance circuit can be determined by the first impedance value and the second impedance value, in combination with the remaining claimed limitations, as called for in independent claim 9; and

c) A low pass filter, in which a seventh resistive device coupled between the first node and the second node, in combination with the remaining claimed limitations, as called for in independent claim 15.
